Your Artwork Library, at a glance

A visual guide to registering references, recording rights, and preparing evidence.

What this page is

The Artwork library holds an artist's registered reference works. CreatorProof compares later candidate images against these references. Candidate scans and flagged cases belong in the User and Admin areas.

How to read the screen

The left side is your collection: search, refresh, and select a work. The larger right workspace contains tools for that selected work. Its tabs are Permissions, Creation history, Origin evidence, and Share & export.

Blue numbered markers

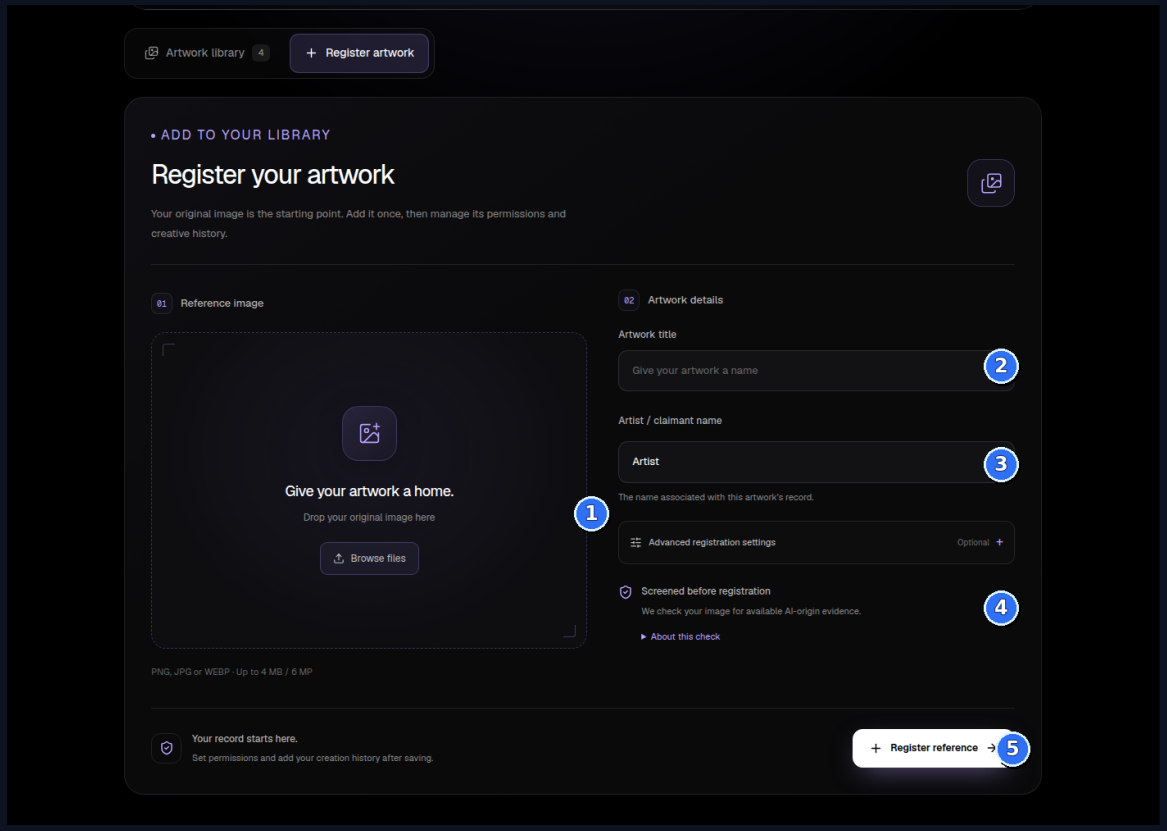

1 switches between the saved library and registration form. 2 filters by title or claimant. 3 reloads the list. 4 selects a reference card. 5 changes tools for the selected work. 6 opens registration.

A detail to remember

Each card has its own workspace. Save a policy or history entry before selecting a different card. The selected work in these screenshots is named "Boy"; its values and the visible record count are example data from the captured local site.

Add the original artwork

Register the reference image that future scans should compare against.

Fill out the form

Open Register artwork. Drop an image in the upload area or browse for a PNG, JPG/JPEG, or WEBP file. The visible form accepts files up to 4 MB and 6 megapixels; you can replace or remove the selection before submitting.

Name the work accurately

Enter a clear Artwork title and the correct Artist / claimant name. The claimant may be prefilled from the current Artist portal. Correct it if the work belongs to another person or organization.

Review optional settings

Usually leave Advanced registration settings unchanged. The normal catalog is artist-library. Available claim labels include Artist-recorded, Supporting record declared, Under review, and Withdrawn. Choose a supporting-record claim only when supporting records actually exist.

Screen, then submit

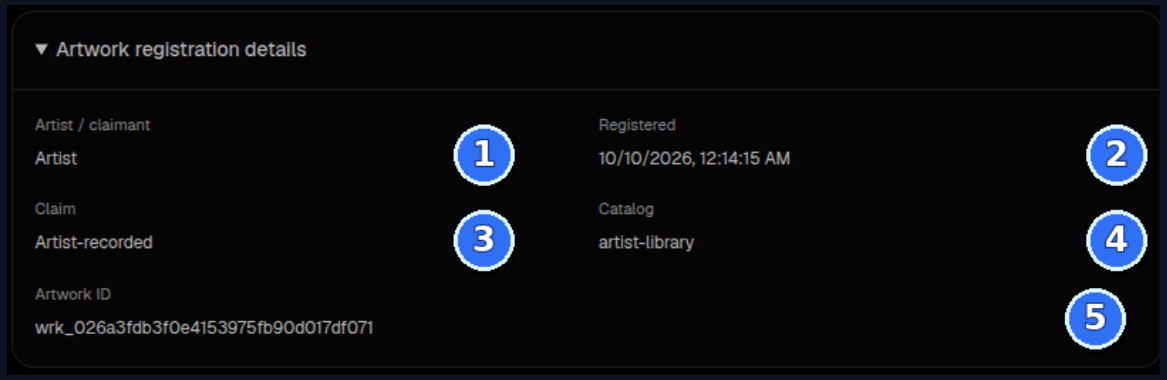

Read the AI-origin screening notice and choose Register reference. If screening refuses the image, review the reason shown by the form. On success, the record receives an Artwork ID and image fingerprints.

Meaning of registration

Registration records the artist's claim; it does not independently establish copyright ownership. Passing origin screening does not prove that an image was made by a person.

Make scans search the right collection

A scan searches one named catalog at a time. The names must match exactly.

Check the saved record

Open Artwork registration details under the selected work. 1 is the claimant, 2 the registration date, 3 the recorded claim state, 4 the catalog, and 5 the Artwork ID. Keep the ID for support or evidence workflows.

Match the catalog name

The registration form and User scan form both default to artist-library. A work stored in creatorproof-collection will not be searched by a scan that uses artist-library. The library can display multiple catalogs together, so its total count is not the count a scan searches.

Before trusting a no-match

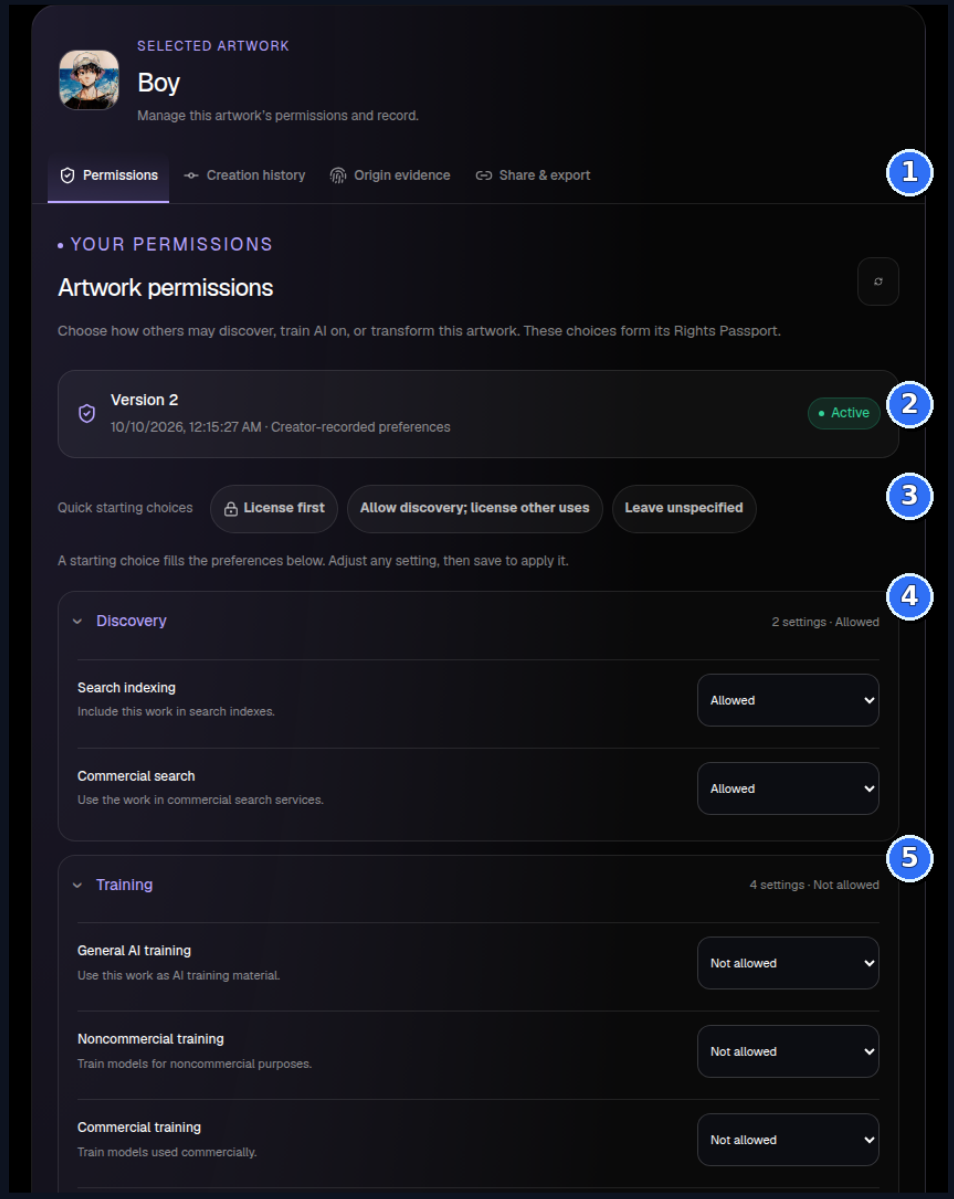

Confirm the selected reference’s catalog matches the scan or monitor’s catalog. If a scan reports an empty catalog, check this first. “No match” means no supported reuse was found in the catalog and sources actually checked; it does not mean the image is unused everywhere.

Claim status in plain terms

“Artist-recorded” means the claim was entered by the artist. It does not mean a third party verified ownership. The screenshot shows current saved data, not universal defaults.

Set the artist’s stated usage preferences

The Rights Passport is a versioned record of what is allowed, restricted, or still needs review.

Start with the saved version

Check the policy Version and Active status. The refresh button reloads the saved policy. The screenshot shows the saved settings for “Boy”; those are not defaults for other works.

Quick starting choices

A preset fills the controls but does not save. Review every field afterward. License first sets every permission to License required. Allow discovery; license other uses allows the two discovery settings and requires a license for the others. Leave unspecified records no preference.

What each choice means

Allowed permits the stated use; Not allowed records that it is not permitted; License required asks for a separate license; Ask for review requires a person to review; Not specified records no preference and is not the same as Allowed; Not applicable means the setting does not apply to this work.

The four permission groups

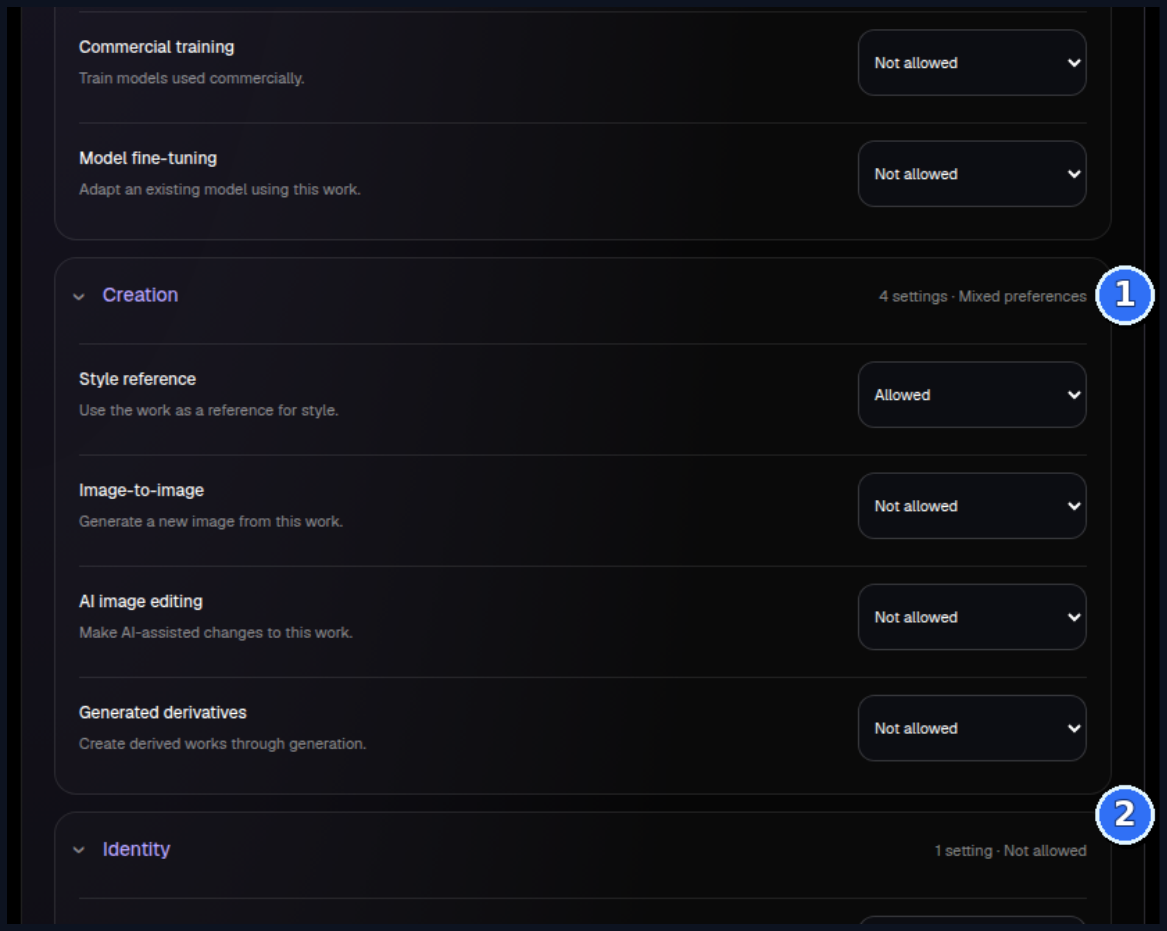

Discovery: Search indexing, Commercial search. Training: General AI training, Noncommercial training, Commercial training, Model fine-tuning. Creation: Style reference, Image-to-image, AI image editing, Generated derivatives. Identity: likeness use for a depicted person.

Then save a new version

Expand groups, choose values that match the artist’s actual intent, add accurate license details if known, and save a new policy version. A preference is not a signed contract, legal ruling, or technical block on outside websites.

Scope each permission carefully

The upper controls cover creation and identity permissions; lower controls add context and limits.

Choose only what is known

The numbered controls in this part of the screen are individual permission choices. Select an option separately for each use. Leave it Not specified if the artist has not decided or the information is not known.

Creation uses

The Creation group records preferences for style reference, image-to-image use, AI editing, and generated derivatives. These are distinct uses: do not assume permission for one automatically covers the others.

Identity / likeness

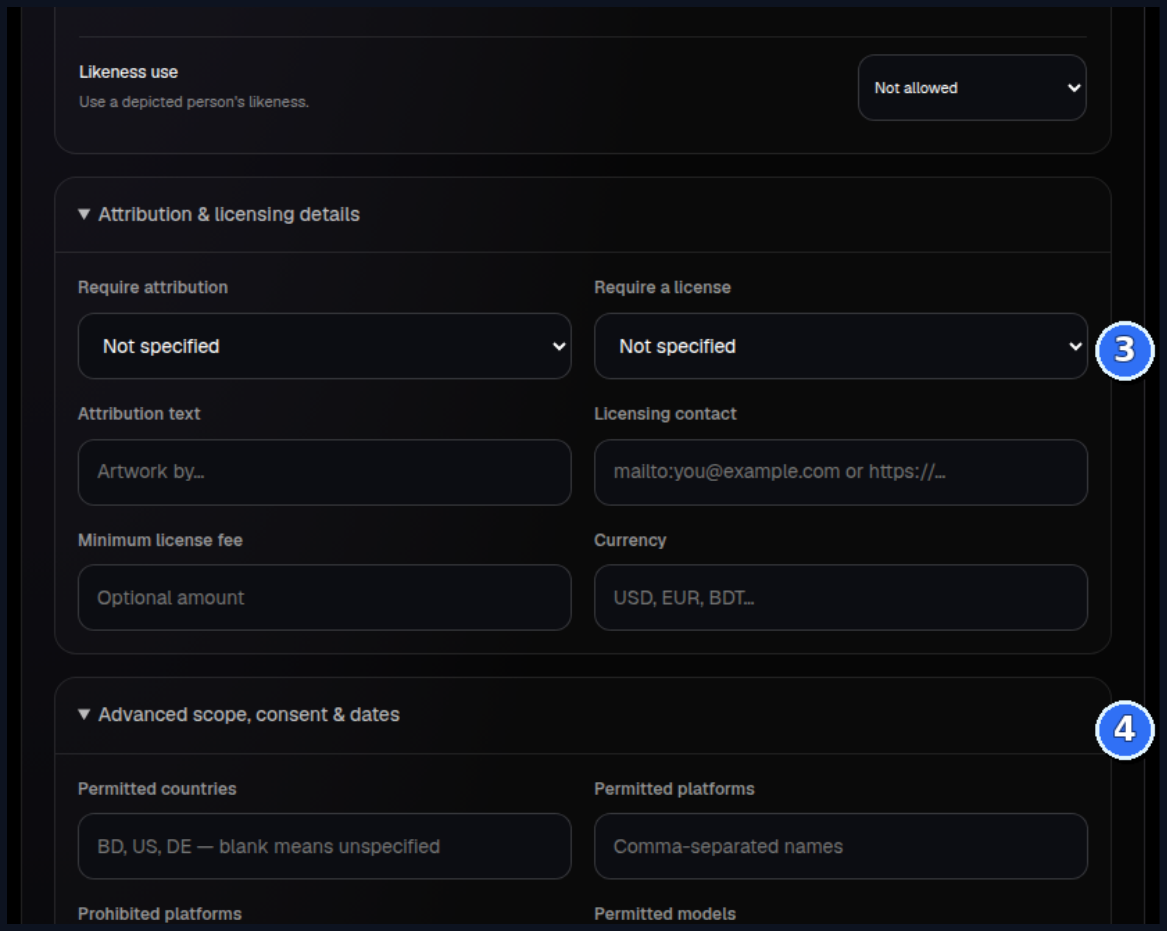

Identity covers likeness use for a depicted person. It is a different question from whether the artwork itself may be used. Record only a preference that the relevant person or authorized representative can make.

Do not overstate what a setting does

These fields record the artist’s declared policy. They do not automatically notify a platform, grant a license, or enforce a restriction on an unrelated service.

Add credit, license, scope, and dates

Specific values make a preference easier to interpret, but they do not make another party comply.

Attribution & licensing details

Record whether credit is required, the exact credit wording, a licensing contact, and a minimum fee and currency when those details are known.

Advanced scope, consent & dates

The lower fields can describe permitted countries, platforms, model identifiers, channels, audiences, transformations, consent status and source, effective dates, and a broad text/data-mining reservation.

Website path and notes

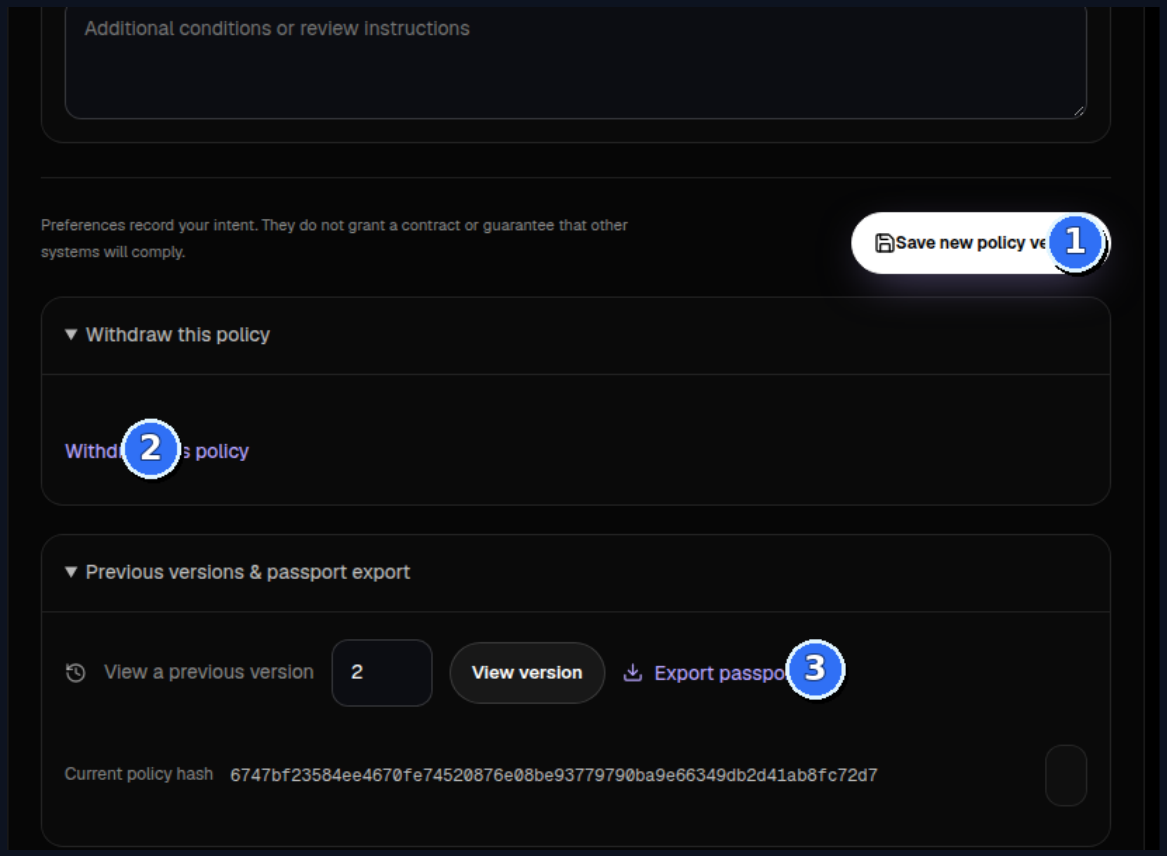

The artwork path is a path on the artist's website used by preference exports; the app does not fetch that URL. Policy notes can capture extra conditions or review instructions.

Good practice

A country list, license fee, or model name narrows the recorded preference. Leave uncertain fields unspecified instead of guessing. Check the artist's intent before saving.

Save, withdraw, and review policy history

Policy edits create versions so you can see what was recorded over time.

1 · Save new policy version

Saving applies the choices and creates a new version. Earlier versions remain in the history. The screenshot is on Version 2; a new record can begin with unknown permissions.

2 · Withdraw this policy

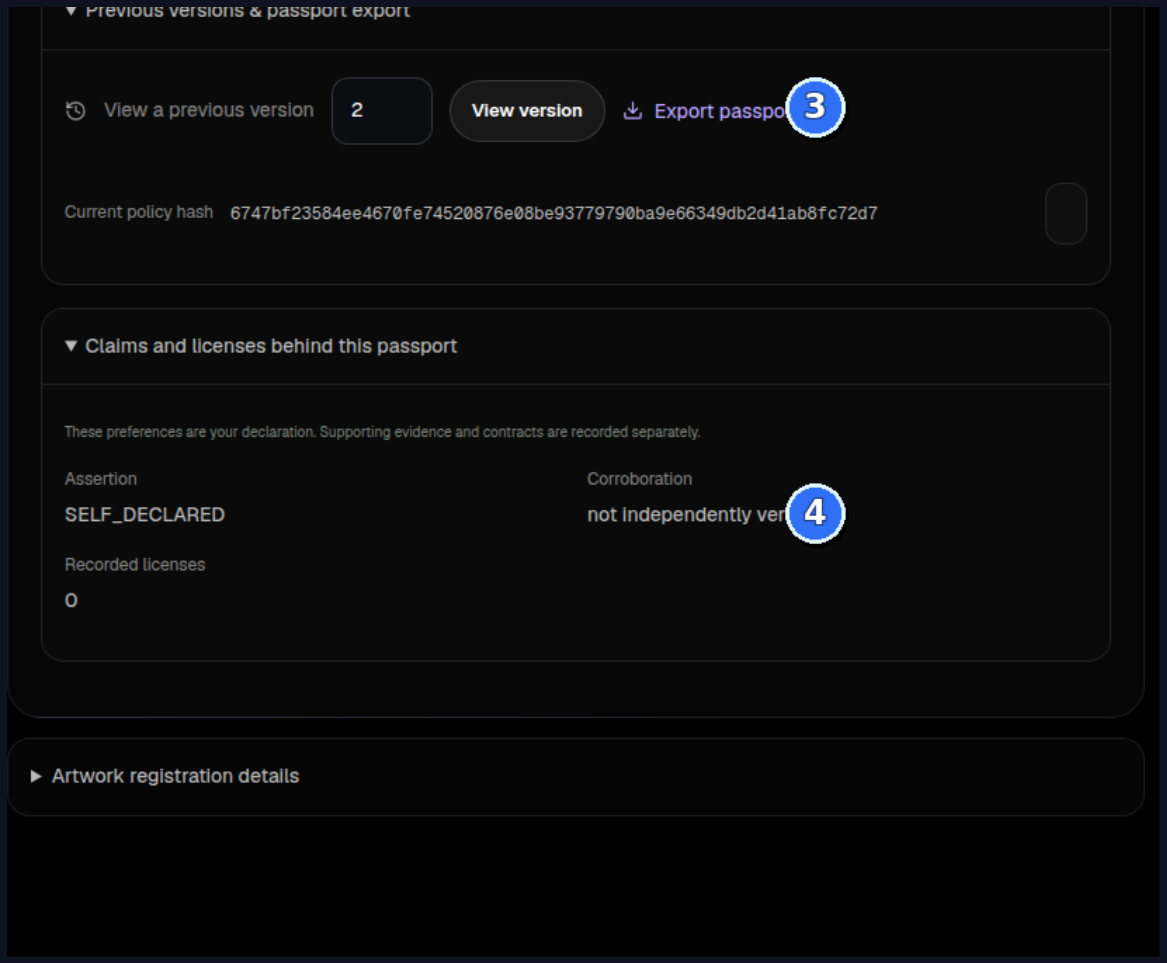

Withdrawal is a recorded action after confirmation. It preserves prior history. Review existing contracts separately; withdrawing a preference does not itself resolve those agreements.

Check before saving

Read each setting, scope and contact detail. Presets are only starting points. Make sure you have not left a value that contradicts the artist’s intended policy.

Read earlier versions and claim records

Exports and claims provide a record; they do not independently prove ownership.

3 · Previous versions & passport export

Choose a version to view it read-only, or export the Rights Passport. A previous version helps explain what was recorded at an earlier point in time.

4 · Claims and licenses

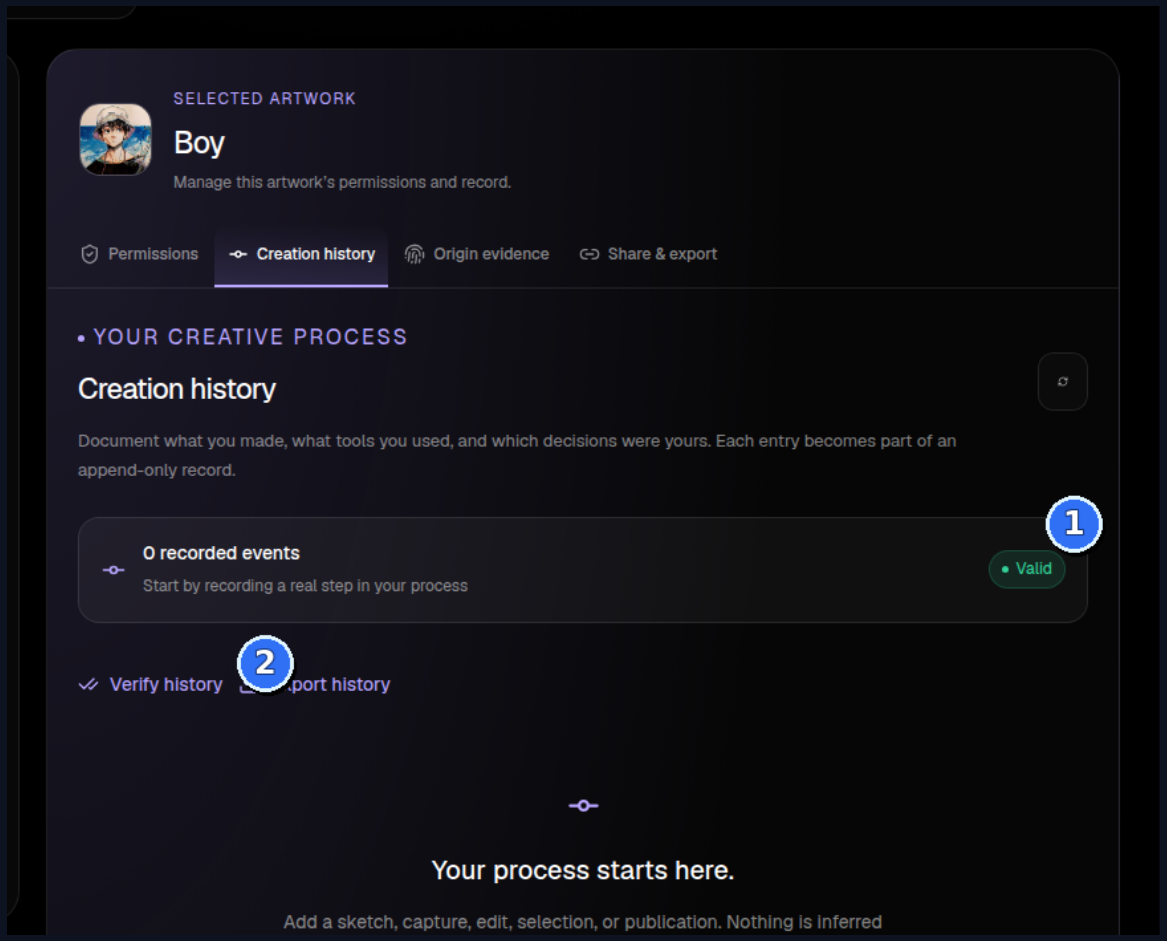

This area separates the artist's assertion from corroborating evidence and recorded licenses. A self-declared claim is not independent verification. Review supporting records and license entries separately.

Keep the limits clear

A Rights Passport is the artist's recorded preference. It is not a court decision, a signed license contract, or a mechanism that forces unrelated websites to follow the preference.

Record the real creative process

Use the timeline to describe truthful steps, people, tools, and decisions.

Integrity and existing events

The top of the tab shows the integrity status and number of recorded events. An empty timeline is normal before you add anything. The screenshot says “Valid” for its current stored chain.

Verify and export

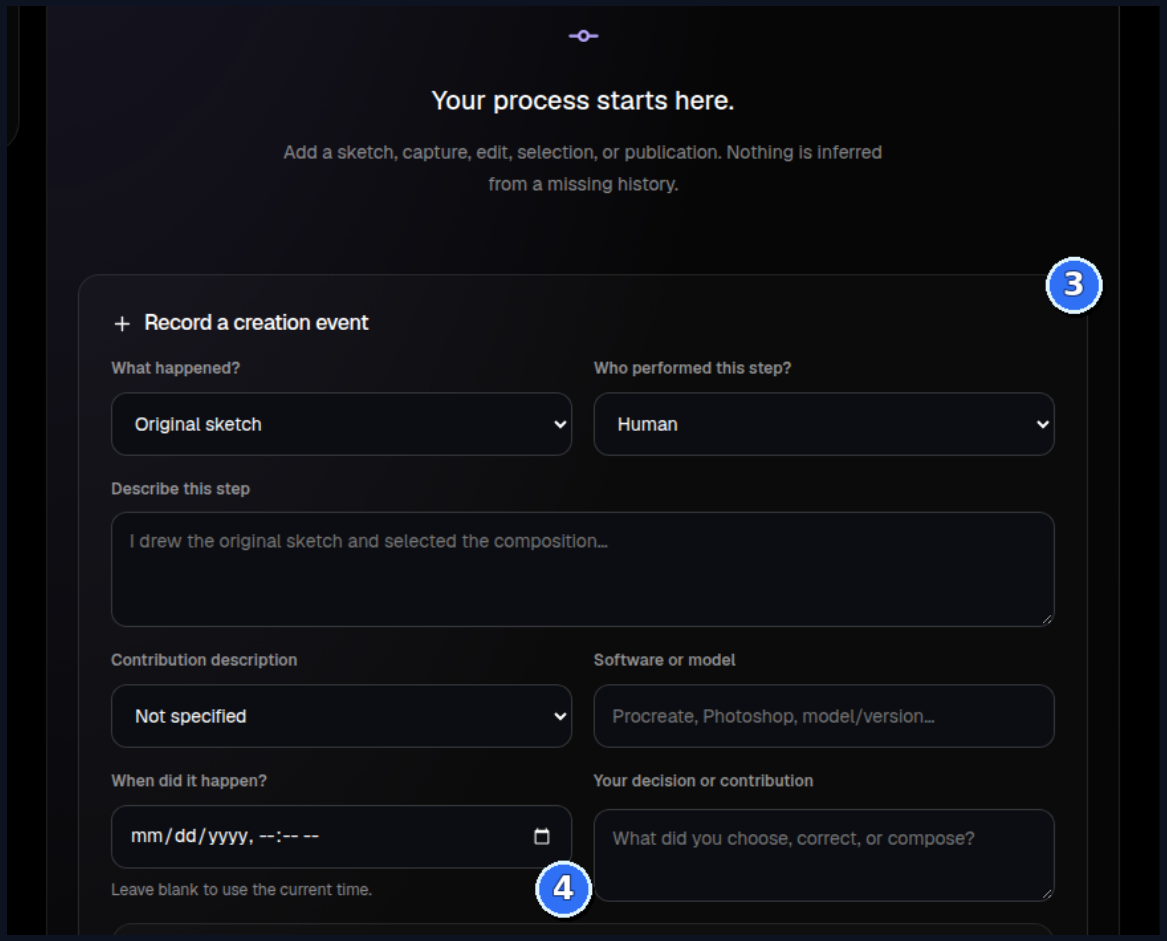

Verify history checks whether the saved event hash chain is consistent. Export history downloads the record. “Valid” means the stored record passed that check; it does not prove the events are true or determine authorship.

Begin with a real step

Examples include an original sketch, manual edit, AI-assisted step, human selection, or publication. Add events in chronological order and describe what actually happened.

Describe who did what and when

The event form keeps the human contribution and any tool assistance explicit.

1 · What happened?

Choose the step type, such as original sketch or edit. 2 · Who performed this step? records Human, AI, system, or unknown.

3 · Describe the step

Explain it in ordinary language. Add the contribution classification, software or model, date, and the human's decision where relevant. Say what the person selected, corrected, composed, or changed.

4 · Supporting assets and references

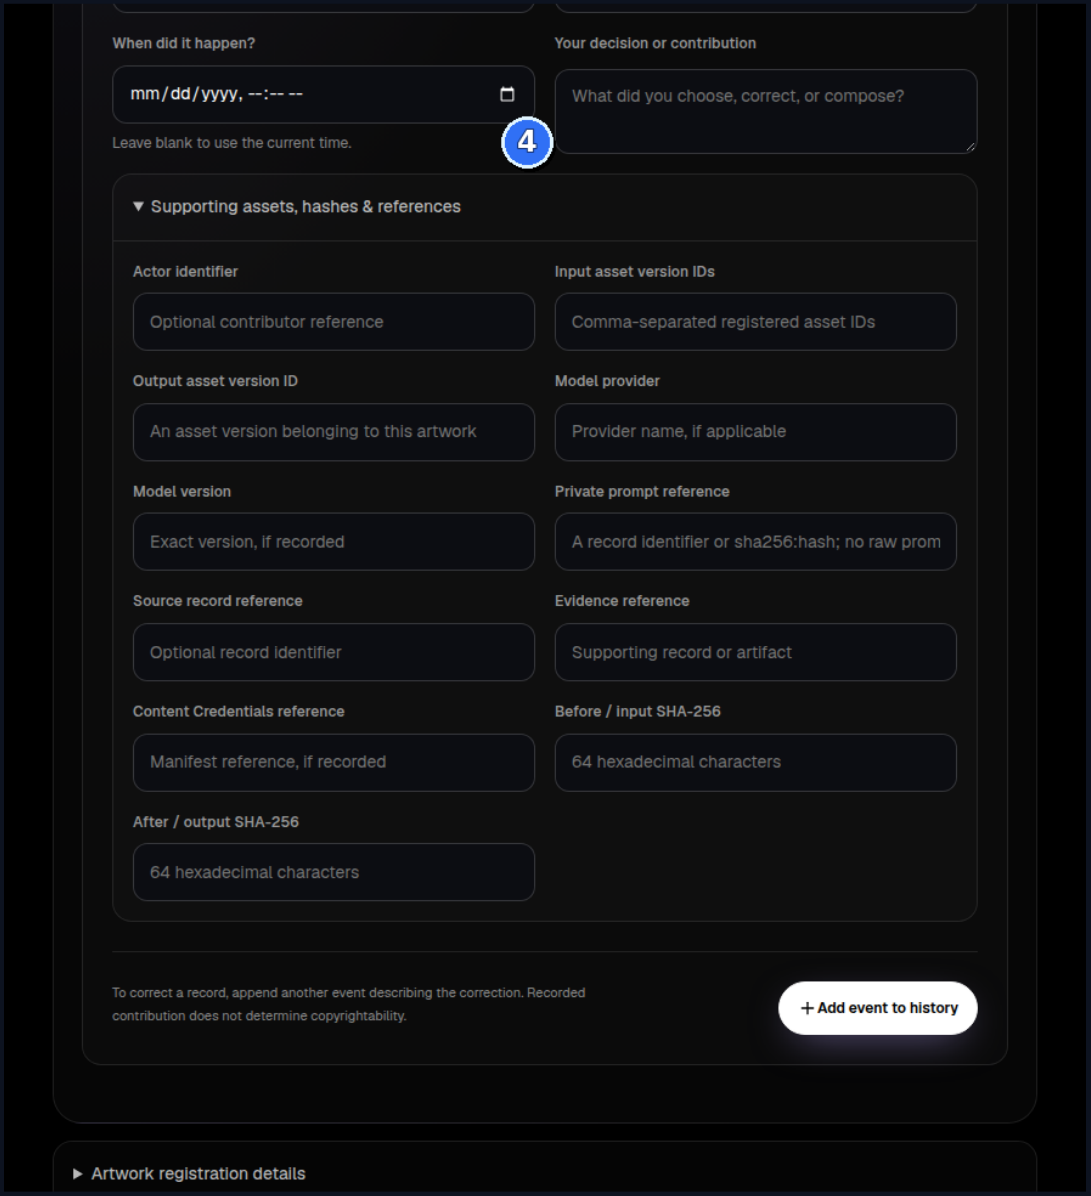

Optional fields can store real asset IDs, input/output version IDs, provider and model versions, source/evidence references, Content Credentials references, and before/after SHA-256 hashes.

Private prompt reference

If recording a prompt, use a private reference or hash. Do not paste a raw prompt into a field that asks for a private prompt reference.

Add events; correct with another event

Creation-history entries are append-only so the record retains its sequence.

Add the event

When the description is accurate, choose Add event to history. Record a real date if known; otherwise the form can use the current time. Do not invent process steps to fill an empty timeline.

Correcting an entry

Entries are append-only. If an earlier event needs correction, add a new event that describes the correction rather than trying to rewrite the earlier record.

What integrity can tell you

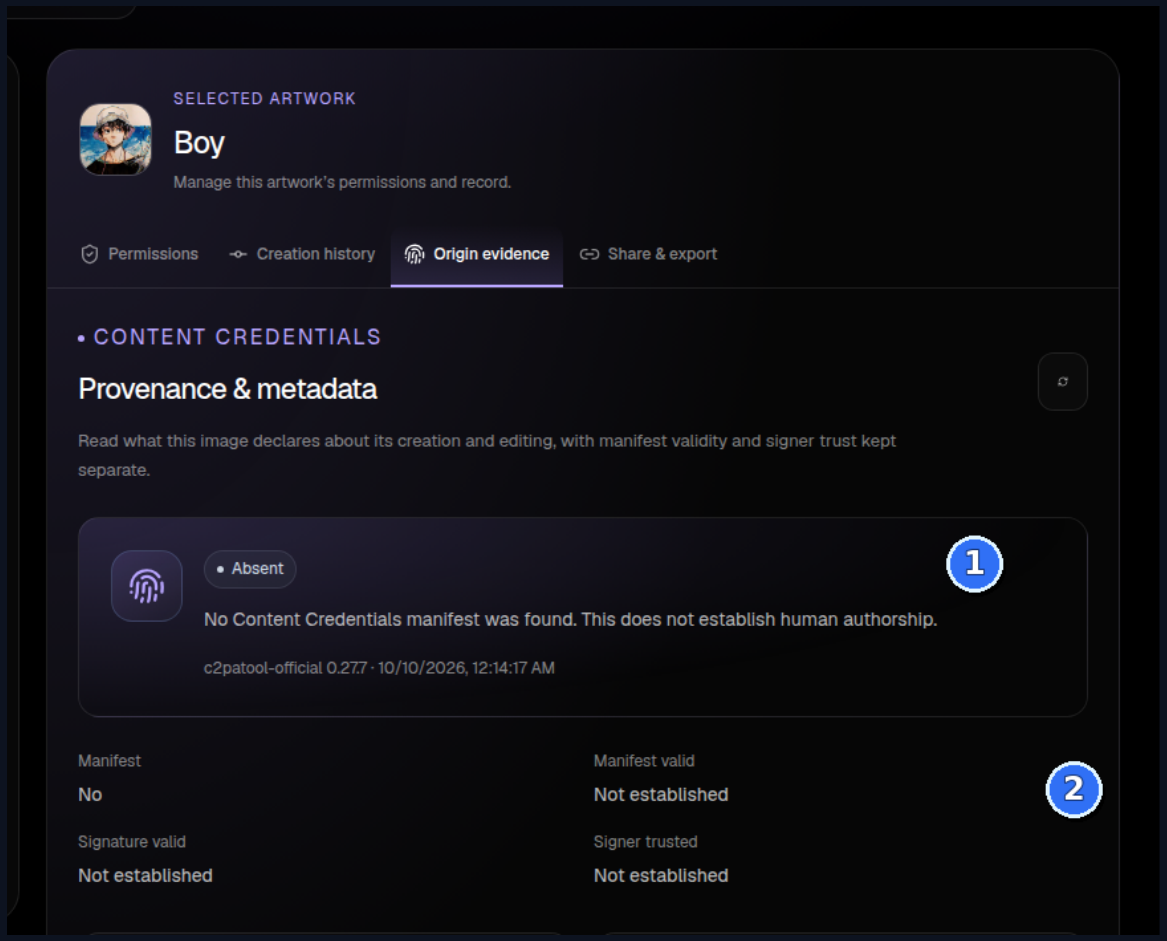

The hash-chain check helps show whether saved entries remain internally consistent. It cannot establish that a description is truthful or decide who owns copyright.

Useful habit

Record important steps soon after they happen, with the tool/version and the human’s contribution while those details are still clear.

Inspect provenance and metadata

This panel reads embedded declarations and metadata; it is separate from copy matching.

Content Credentials result

The top result summarizes whether a supported Content Credentials manifest was found and inspected. A found manifest is not automatically valid or trusted.

Read the facts separately

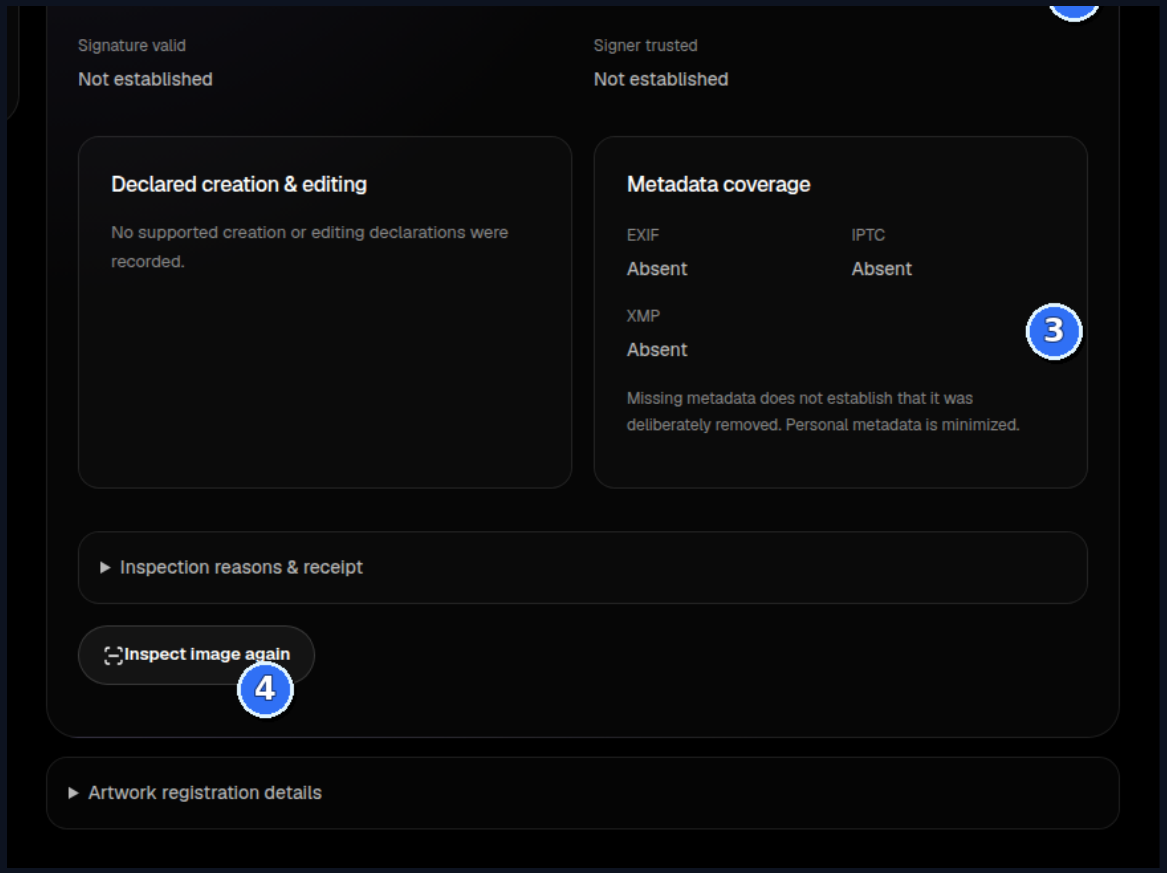

Manifest presence, manifest validity, signature validity, and signer trust are distinct facts. One does not imply the others. Declared creation and editing shows actions or models in a supported manifest, when present.

Not the copy detector

Origin evidence is not the AI-origin detector and is not the artwork-copy comparison. Use the relevant scan and assessment panels for those separate questions.

Understand an absent result

Missing metadata is a limited observation, not a conclusion about who made the image.

Metadata coverage

The panel reports whether EXIF, IPTC, and XMP metadata were found. Missing metadata does not prove someone removed it.

Inspection receipt

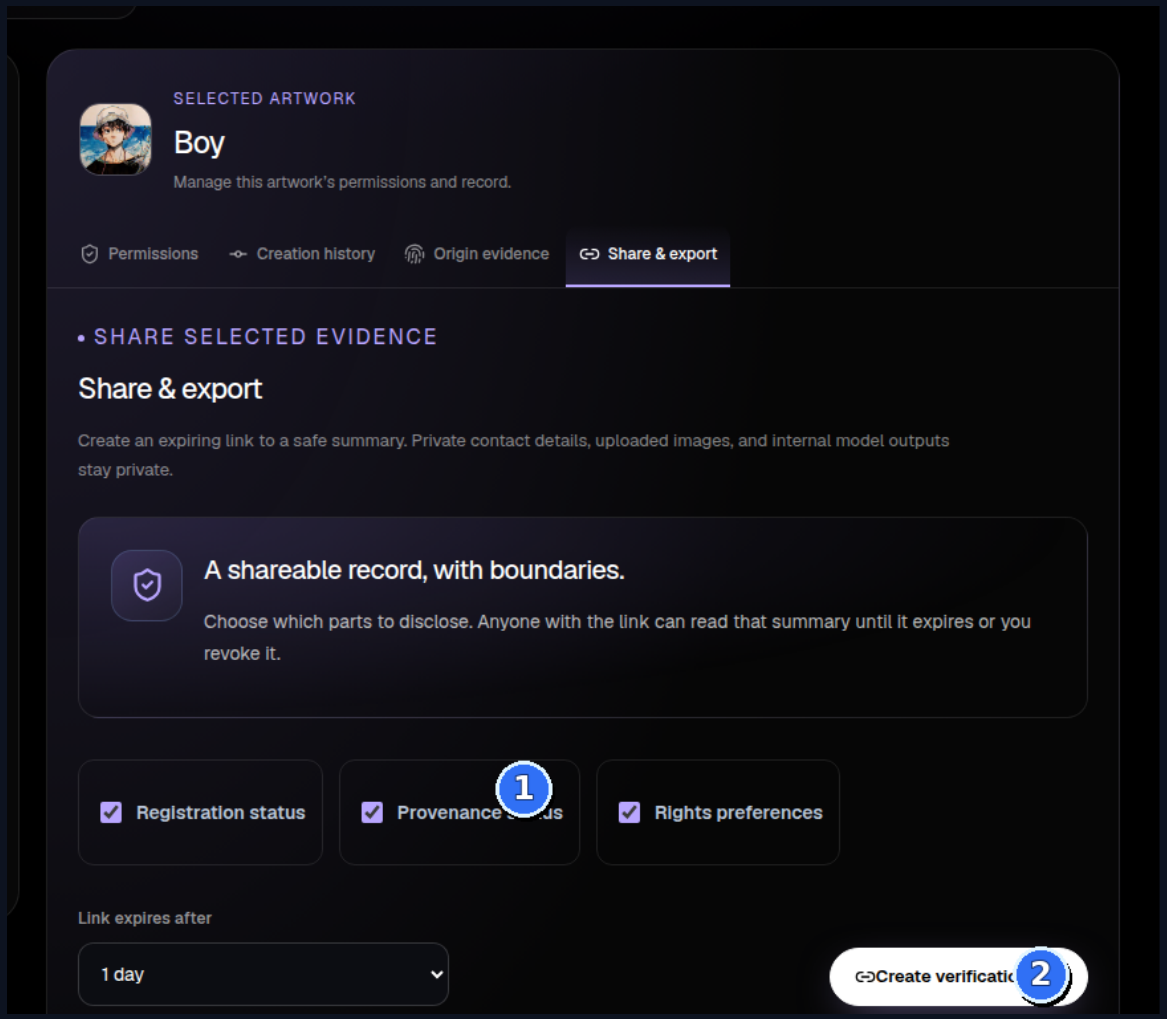

Open Inspection reasons & receipt to read reason codes and the inspected image hash. Inspect image again runs and saves another inspection; earlier inspection records are preserved. Refresh reloads the current saved result.

This screenshot says Absent

It means no Content Credentials manifest was found in the inspected image. It does not prove human authorship, prove AI use, or settle whether copying occurred. Treat the result as evidence only about available declarations and metadata.

Create a limited verification link

Choose which facts to disclose and how long the link should remain active.

Choose the share scope

Select any relevant items: Registration status, Provenance status, and/or Rights preferences. The recipient can read the selected minimized summary through the link.

Choose expiry and create

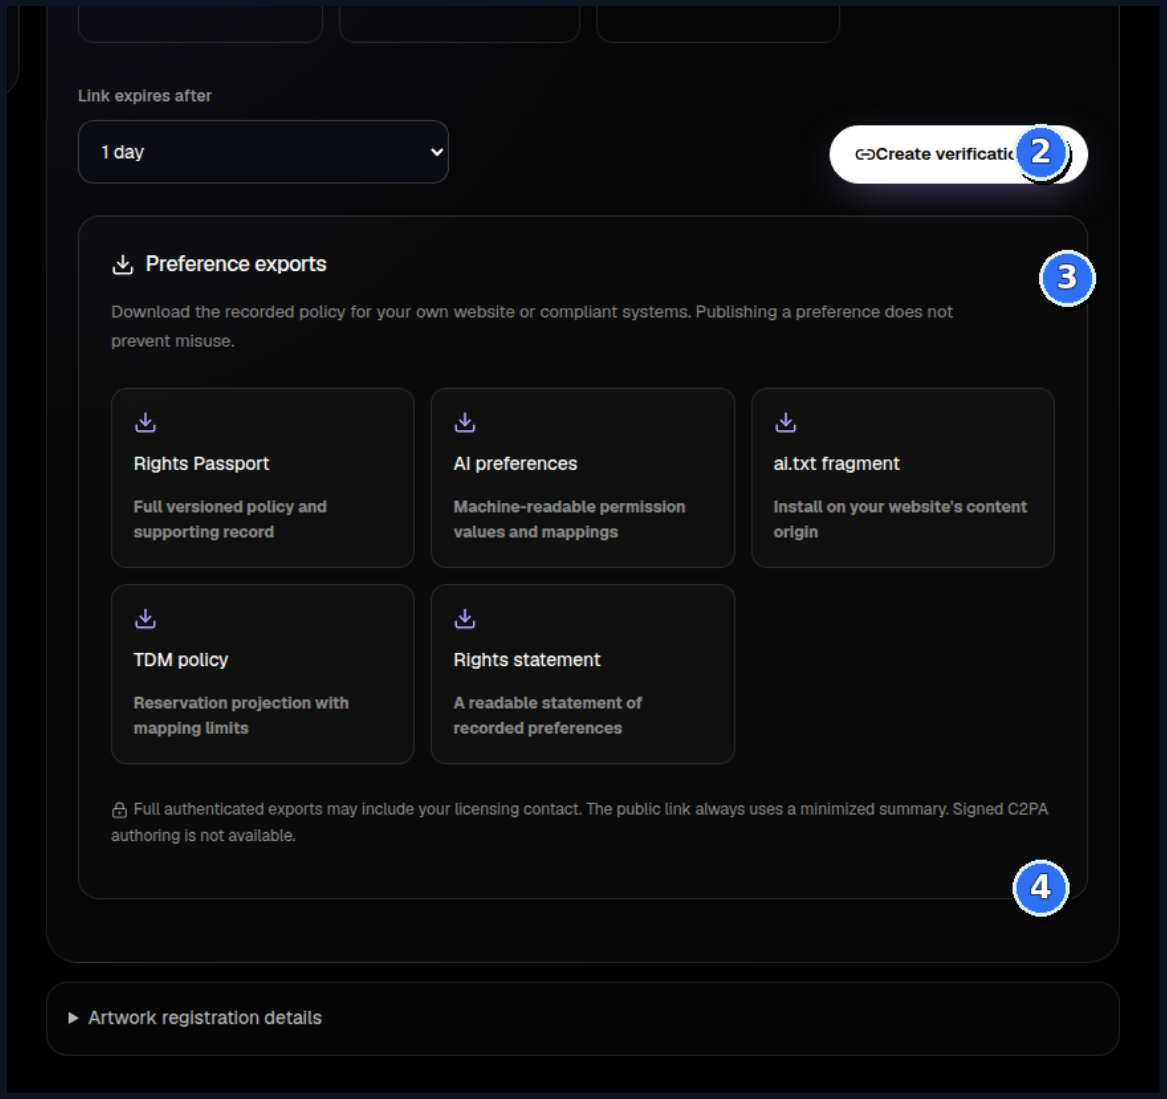

Pick 1 hour, 1 day, 7 days, or 30 days, then choose Create verification link. Copy it and send it only to people who should see that summary.

Treat the link like a secret

Anyone who has the link can access it until it expires or you revoke it. The link list is saved in this browser; revoke active links there when they are no longer needed.

Download preferences and check privacy

Preference files are downloads; someone must publish them on the artist's website.

Available preference exports

The screen offers Rights Passport JSON, AI preferences JSON, an ai.txt fragment, TDM policy JSON, and a readable rights statement. These files do not install themselves on a website. The artist or site operator must publish the relevant file at the correct location.

Privacy boundary

The public verification link omits private contact details, uploaded images, and internal model outputs. A full authenticated export may include a licensing contact, so inspect it before sharing.

Limits

An export or verification link does not prevent misuse. Signed C2PA authoring is not available in this screen.

A safe, useful first-use sequence

Follow these steps from registration through a candidate scan and human review.

SET UP THE REFERENCE

- 1. Register the original image with a clear title and correct claimant.
- 2. Open registration details and confirm the catalog. Keep artist-library if you want it in the default User scan.
- 3. Open Permissions. Choose a starting preset only if it reflects the artist’s real intent; review every group and add accurate attribution, contact, and scope details. Save the policy version.
- 4. Add known, real creation steps. Verify the history and export it if you need a portable record.

INSPECT, SHARE, AND REVIEW

- 5. Check Origin evidence for signed creation declarations and metadata. Read absent or unavailable as “not found/checked,” not as proof of human origin.
- 6. Share only the facts needed, or download a preference file. Publishing a downloaded file is a separate website task.
- 7. In the User portal, submit a candidate and scan the same catalog. A flagged scan becomes available in Admin for human review.
- 8. Compare the evidence and make a reasoned decision. A model score alone is not a legal finding.

WHAT THESE TOOLS DO NOT PROVE

- A registration, artist-recorded claim, integrity hash, or similarity score does not by itself prove legal ownership or infringement.
- The Artwork library does not display candidate detections; those appear in the User and Admin workflows.
- A permission preference is not a contract and does not enforce itself across the web.

READ RESULTS WITH CARE

- A no-match result covers only the catalog and sources actually checked; it cannot establish that an image is unused everywhere.
- Metadata inspection describes available embedded declarations. It cannot determine every tool used to create an image.
- Integrity status checks record consistency, not whether a human-authored event is truthful.

Where to find the walkthrough details

Use the matching page tab and numbered markers when following along in the Artist portal.

Library and registration

Pages 1–3 · collection controls, Register artwork, record details, and catalog matching.

Permissions

Pages 4–8 · quick choices, individual permission settings, scope, version history, and claims.

Creative process and provenance

Pages 9–13 · Creation history fields, integrity checks, Content Credentials, and metadata.

Share and export

Pages 14–15 · verification links, expiration, preference files, and privacy.

First-use checklist and boundaries

Page 16 · an end-to-end operating sequence and the limits of each type of evidence.
